Chapter 1 Introduction

This manual includes explanations on how to use a POSPrinter with EPSON OPOS ADK for .NET, as well as related items and device-specific precautions.

For details on the POS for .NET API, refer to the "UnifiedPOS Retail Peripheral Architecture Version 1.14.1" specification and the MSDN "POS for .NET v1.14.1 SDK Documentation":

http://www.omg.org/retail/unified-pos.htm https://msdn.microsoft.com/en-us/library/bb429024(v=winembedded.4).aspx

1.1 Terminology

- "UnifiedPOS Retail Peripheral Architecture Version 1.14.1" may be abbreviated as "UPOS".
- "Microsoft POS for .NET" may be abbreviated as "POS.NET".
- "EPSON OPOS ADK for .NET Version1.14.6" may be abbreviated as "OPOS.NET".
- "POSPrinter" and "printer" may be referred to as "device".
- "ServiceObject of POSPrinter provided by OPOS.NET" may be abbreviated as "ServiceObject".
- "ErrorCode properties of PosControlException" may be abbreviated as "ErrorCode".
- "ErrorCodeExtended properties of PosControlException" may be abbreviated as "ErrorCodeExtended".
- "JrnLineChars", "RecLineChars", "SlpLineChars" and other properties
 defined commonly for stations may appear as "Stn". For example,
 "StnLineChars" character strings for indicating stations.
- "Exception" indicates "PosControlException".
- The EPSON original device constant used with this device is defined in "jp.co.epson.uposcommon.EpsonUPOSConst" and "jp.co.epson.uposcommon.EpsonPOSPrinterConst".
- Inch: 1 inch is 25.4 mm.
- "dpi" is the number of dots per inch.
- The language specification of the device may be indicated as follows.

ANK specification: Device without multi-byte characters
JP specification: Japanese compatible device

1

- Wired LANs and wireless LANs may be referred to as networks.
- A "receipt", "journal", or "slip" indicates either a station or paper depending on the context.
- Similar devices are referred to as follows.

TM-U220 TM-U220A/TM-U220B/TM-U220D

NVRAM indicates non-volatile random access memory.

Chapter 2 Before Using POSPrinter

This chapter includes explanations on how to set up a POSPrinter, as well as precautions and restrictions on use.

2.1 Device Setup

After checking the model and settings of the hardware, use the SetupPOS utility to select the correct device. For details on how to configure hardware, refer to "Hardware Settings" for each device in "Appendix-C Hardware Settings". For details on how to use the SetupPOS utility, refer to the User's Reference Guide and "Appendix-B SetupPOS Settings".

2.2 Precautions and Restrictions

- Only DTR/DSR device flow control is supported.
- If you turn the device off and then on or open the cover during printing, unnecessary data may be printed.
- Wait at least five seconds after the device has been turned off before turning it back on.
- Using ESC|#E to send data may hinder the subsequent operations of the ServiceObject or cause an unexpected result because the sent data is not checked by ServiceObject.
- Sending a print control command is not recommended. Careful consideration is required before sending such a command.
- Not all Unicode characters can be printed even if
 PosCommon.CharacterSetUnicode is specified in the CharacterSet property.
 The assignment of Unicode characters to printable characters is limited to the characters installed on the device. The characters installed on a device vary depending on the device specification. Please refer to the product specification for your particular device.
- Any character code (Unicode) expressed in the string type is converted to a
 byte code based on the value set in the **CharacterSet** property. Be careful if
 you want to specify the extended ASCII code for byte code conversion.
- All properties and parameters of a method affected by the MapMode property are processed by "dot". Therefore, when the MapMode property is other than MapMode.Dots, an error of ±1 may be produced in the property and the

- parameter of the method affected by the **MapMode** property.
- Only a value described in the StnLineCharsList property can be set in the StnLineChars property. If a value other than a value described in the StnLineCharsList property is set, the value is set to the nearest value that is smaller in the StnLineCharsList property. However, an exception is thrown if a value larger than the largest value described in the StnLineCharsList property is set.
- If 254 or 255 is specified in the CharacterSet property and PTR_DI_NONE is the specification of the PTR_DI_BINARY_CONVERSION command of the DirectIO method, the Unicode encoding name becomes the system default encoding name.

Chapter 3 Properties, Methods, and Events

3.1 Properties

The properties listed below differ from functions described in UPOS.

3.1.1 CapPowerReporting Property

Description

Identifies the reporting capabilities of the device. One of the following values is set.

Value	Meaning
PowerReporting.Standard	The value set when a serial connection is established.
	ServiceObject can determine and report
	two of the power states: OFF_OFFLINE
	(the device is off or offline) and ONLINE.
PowerReporting.Advanced	The value set when a parallel, USB and
	network connection is established.
	ServiceObject can determine and report
	three of the power states: OFF, OFFLINE,
	and ONLINE.

3.1.2 CapCharacterSet Property

Description

This property is initialized by the **Open** method according to the "Multi Byte Character Type" setting of SetupPOS. However, after the **Claim** method is executed, the value may be changed depending on the actual language of the device.

One of the following values is set.

Value	Meaning
CharacterSetCapability.Unicode	Able to print the equivalent to a
	Unicode character, within the limits
	of the printable characters of the
	device.

3.1.3 CharacterSet Property

Description

Only a value in the CharacterSetList property can be set.

If the value of the property is set to 932, the print character for the ASCII code 0x5C is changed to the yen mark (¥).

The property is initialized to one of the following values.

Value	Meaning
CharacterSetUnicode(997)	Print an equivalent Unicode character, within the limits of the printable characters
	of the device.

After the **Claim** method is executed, the value may be changed depending on the actual language specification of the device.

This property is initialized by the **Open** method according to the SetupPOS setting "CharacterSet".

The same Unicode code point is assigned to some characters which are defined in both the device Kanji and non-Kanji character tables.

e.g.:

U+0391(Greek Capital Letter Alpha)

6

Application Development Guide POSPrinter (TM-U220A/U220B/U220D)

CharacterSet 932(Shift-JIS) 0x839F CharacterSet 737(Greek) 0x80

If the **CharacterSet** property is set to 997 or 932, data will be printed using the Kanji font.

To print a single-byte character, please set the **CharacterSet** property to 737.

3.1.4 CharacterSetList Property

Description

This property is initialized by the **Open** method according to the "Multi Byte Character Type" setting of SetupPOS.

However, after the **Claim** method is executed, the value may be changed depending on the actual language specification of the device.

3.1.5 MapMode Property

Description

All properties and parameters of a method affected by the **MapMode** property are processed by "dot".

When the **MapMode** property is other than MapMode.Dots, an error of ±1 may be produced in the property and the parameter of the method affected by the **MapMode** property.

3.1.6 RecLineChars Property

Description

After the **Claim** method is executed, the value may be changed according to the specification of the device.

Only a value in the **RecLineCharsList** property can be set.

If the value set is other than a value in the **RecLineCharsList** property and is smaller than the maximum value supported by the printer, the value is set to a value that is larger and the nearest value in the **RecLineCharsList** property.

3.1.7 RecLineCharsList Property

Description

After the **Claim** method is executed, the value may be changed according to the specification of the device.

3.1.8 RecLineSpacing Property

Description

A value smaller than the **RecLineHeight** property can also be set. If a value smaller than the **RecLineHeight** property is set, character strings in the first and second lines overlap when printed.

3.1.9 RecLineWidth Property

Description

After the **Claim** method is executed, the value may be changed according to the specification of the device.

3.1.10 RecLetterQuality Property

Description

When this property is changed, other properties, such as printing resolution and control method of the head are changed.

They vary depending on the head type of the station.

However, changing the printing resolution does not change the values of properties such as **RecLineWidth** and **RecLineSpacing**.

Station	Description of Change
Receipt	Specifying/canceling of unidirectional
	printing.

3.1.11 DeviceEnabled property

Description

When the **DeviceEnabled** property is set to TRUE first after the Claim method is executed, device initialization is performed.

In the following states, device initialization cannot be done:

- Offline (e.g. Cover open, out of paper, etc.)
- Error (e.g. Paper jam)

When the **DeviceEnabled** property is set to TRUE, the printer state is notified via a **StatusUpdateEvent**.

If the **StatusUpdateEvent** for the printer stat is not defined in UPOS, however, the **StatusUpdateEvent** cannot be notified. In this case, the printer status can be found by examining the exception that is notified when the method is executed.

8

Application Development Guide POSPrinter (TM-U220A/U220B/U220D)

If the device initialization cannot be done when the **DeviceEnabled** property is set to TRUE, a device status is checked at an interval of 1 second, and it is repeated until the device initialization is performed completely.

The device initialization status can be found by enabling the **PowerNotify** property.

When StatusPowerOnline is notified by a **StatusUpdateEvent**, the initialization process is complete.

In addition, the initialization process may take several seconds depending on the connection speed and the image registration status.

3.2 Methods

The methods listed below differ from functions described in UPOS.

3.2.1 Claim Method

Description

The device connection state is confirmed. If the device is not connected, or if the power is OFF, an exception is thrown. In the case of a Serial connection, the device connection state cannot be confirmed. In this case, Success is always returned. In the case of a USB connection where the "Port Name Type" is set to "Device Name", if the printer is in an error state, an exception is thrown.

3.2.2 Release Method

Description

The connection is disconnected at the port where the device is connected.

3.2.3 CheckHealth Method

Description

All functions of the **CheckHealth** method are supported.

Level	Outline of Function
HealthCheckLevel.Internal	The state of the device is checked based on the information held in the current
	ServiceObject (no action is taken on the device).
HealthCheckLevel.External	A test print of the following character
	strings is performed on the station
	selected currently.
	External HCheck !!
	EPSON UPOS ADK
	ServiceVersion=version of the
	ServiceObject
	DeviceName=device name
HealthCheckLevel.Interactive	The following dialog box appears.
	POSPrinter Service
	Close
	Print

Click [Print] button.

Press the Print button to perform the test.

A test print of the following character strings is performed on the station currently selected.

- Interactive HCheck !!
- EPSON UPOS ADK
- ServiceVersion=version of the ServiceObject
- DeviceName=device name

Press the Close button to end the test.

The results are stored in the ${\bf CheckHealthText}$ property.

And besides, the following value is retrieved as the returned value of 11

Application Development Guide POSPrinter (TM-U220A/U220B/U220D)

method.

level	Value	Meaning
HealthCheckLe	evel.Internal	
	Internal HCheck: Successful	The CheckHealth method finished normally.
	Internal HCheck: Error- <message></message>	The CheckHealth method finished with an error. The Message contains error information.
HealthCheckLe	evel.External	
	External HCheck: Successful	The CheckHealth method finished normally.
	External HCheck: Error- <message></message>	The CheckHealth method finished with an error. The Message contains error information.
HealthCheckLe	evel.Interactive	
	Interactive HCheck: Canceled	The CheckHealth method finished without doing anything.
	Interactive HCheck: Complete	After the last operation ended normally, the CheckHealth method finished.
	Interactive HCheck: Error- <message></message>	After the last operation finished with an error, the CheckHealth method finished. The Message contains error information.

3.2.4 ClearOutput Method

Description

In asynchronous mode, only output data that is non-transmitted transaction data is deleted. Therefore, data in the current transmission and data sent to the device but not printed is not deleted.

3.2.5 DirectIO Method

Description

This method can be used when the **DeviceEnabled** property is true. The **DirectIO** method supports the following functions.

command	Outline of Function
PTR_DI_OUTPUT_NORMAL	Sends the specified code to the
DTD DI QUITDUT DEALTIME	device using flow control.
PTR_DI_OUTPUT_REALTIME	Sends the specified code to the device without using flow
	control.
PTR_DI_PANEL_SWITCH	Enables/disables the panel
	switch.
PTR_DI_RECOVER_ERROR	Recovers from a recoverable
	error.
PTR_DI_BINARY_CONVERSION	Specifies the character string
	format specified in the
	parameter of the string type.
PTR_DI_GET_SUPPORT_FUNCTION	Returns the functions
	supported by the device
	currently connected.
PTR_DI_RING_BUZZER_WITH_TIME	Executes buzzer control.

PTR_DI_OUTPUT_NORMAL Command

Parameter

command PTR_DI_OUTPUT_NORMAL

data Not used

object(byte[]type) Transmission data

Description

Sends data specified by the *object* parameter to the device directly using flow control.

Use this command only when sending an ESC/POS command to the device.

The ServiceObject does not check data sent by this command. Do not send ESC/POS commands that change the line feed amount or font size, since doing so will hinder the subsequent operations of the ServiceObject.

PTR_DI_OUTPUT_REALTIME Command

Parameter

command PTR_DI_OUTPUT_ REALTIME

data Not used

object(byte[]type)
Transmission data

Description

Sends data specified by the *object* parameter to the device directly without using flow control.

Use this command only when sending a real-time ESC/POS command to the device.

As this command is sent without using flow control, garbled printing may occur if there is any unsent data in the ServiceObject.

In the case of an USB or network connection, a command cannot be sent without using flow control. Therefore, an exception is thrown if this command is executed when the device is in a busy state.

PTR_DI_PANEL_SWITCH Command

Parameter

command PTR_DI_PANEL_SWITCH

data Specify ON/OFF (0 is OFF and 1 is ON)

object Not used

Description

Enables/disables the panel switch.

The panel switch is enabled if *data* is set to ON (1) and disabled if *data* is set to OFF (0).

Depending on the type of device, there may be exceptions such as the following.

- During switch standby when a macro is being executed, the switch is enabled regardless of the setting.
- When the cover is open, the switch is disabled regardless of the setting.

PTR_DI_RECOVER_ERROR Command

Parameter

command PTR_DI_RECOVER_ERROR

data Not used object Not used

Description

Recovers from a recoverable error.

This command sends the error recovery command to the device without using flow control.

Do not use this command when the device is in a non-recoverable error state.

In the case of an USB or network connection, a command cannot be sent without using flow control. Therefore, an exception is thrown if this command is executed when the device is in a busy state.

PTR_DI_BINARY_CONVERSION Command

Parameter

command	PTR_DI_BINARY_CONVERSION
data	Specify one of the following.
	• PTR_DI_BC_NONE
	• PTR_DI_BC_NIBBLE
	PTR_DI_BC_DECIMAL
object	Not used

Description

Specifies the character string format specified in the parameter of the string type.

The specification is the same as that of the **BinaryConversion** property of OPOS.

Use this command for the printing of two dimensional codes and for a **CharacterSet** property for which Unicode specification is not possible. The setting of this command is valid for the following methods.

- **PrintNormal** method (only when the **CharacterSet** property is a blank page [254, 255])
- **PrintImmediate** method (only when the **CharacterSet** property is a blank page [254, 255])

PTR_DI_GET_SUPPORT_FUNCTION Command

Parameter

command	PTR_DI_GET_SUPPORT_FUNCTION
data	Not used
object	Not used

Description

Indicates the functions supported by the currently connected device with the logical OR of the function flag, and stores the returned value in the Data property of DirectIOData.

The value 0 is always stored in the *Data* property.

PTR_DI_RING_BUZZER_WITH_TIME Command

Parameter

command	PTR_DI_RING_BUZZER_WITH_TIME
data	Specifies the buzzer operating time
	(milliseconds).
object	Not used

Description

Sounds the buzzer for the time specified with the *data* parameter.

The settable buzzer operating time is 0 to 510 milliseconds.

This command can only be executed when the device is used with a network connection. If other connections are used, an exception is thrown.

3.2.6 ResetStatistics Method

• Parameter type: Microsoft.PointOfService.StatisticCategories

Parameter

Microsoft.PointOfService.StatisticCategories

Specify one of the following.

- StatisticCategories.Upos
- StatisticCategories.Manufacturer
- StatisticCategories.All

Description

Of the items included in the specified category, only the items for which O appeared for the permission reset in "Appendix-F DeviceStatistics" are reset.

All the statistics supported by the ServiceObject are defined in UPOS. If "StatisticCategories.Manufacturer" is specified, nothing is reset.

• Parameter type: String[]

Parameter

String[]

An array of the item names to reset

Description

Of the items included in the specified category, only the items for which O appears for the reset permission in "Appendix-F DeviceStatistics" are reset when "U_", "M_", or an empty string is specified for item names. If an illegal item name or non-resettable item name is included, this method reports an error. When this happens, correctly specified items are also not reset.

All the statistics supported by the ServiceObject are defined in UPOS. If "M_" is specified, nothing is reset.

3.2.7 ResetStatistic Method

Description

Of the items included in the specified category, only the items for which O appears for the reset permission in "Appendix-F DeviceStatistics" are reset when "U_", "M_", or an empty string is specified for item names. If an illegal item name or non-resettable item name is specified, this method reports an error.

All the statistics supported by the ServiceObject are defined in UPOS. If "M_" is specified, nothing is reset.

3.2.8 RetrieveStatistics Method

• Parameter type: Microsoft.PointOfService.StatisticCategories

Parameter

Microsoft.PointOfService.StatisticCategories

Specify one of the following.

- StatisticCategories.Upos
- StatisticCategories.Manufacturer
- StatisticCategories.All

Description

The Statistics supported by ServiceObject are all defined in UPOS. If "StatisticCategories.Manufacturer" is specified, the minimum information specified by UPOS (the 4 items; UPOS version, manufacturer name, device name, and device category) is acquired.

• Parameter type: String[]

Parameter

String[]

An array of the item names to retrieve

Description

If an illegal item name is included, this method reports an error. The Statistics supported by ServiceObject are all defined in UPOS. If "M_" is specified, the minimum information specified by UPOS (the 4 items; UPOS version, manufacturer name, device name, and device category) is acquired.

Parameter type: None

Description

The information of all defined items is retrieved.

3.2.9 RetrieveStatistic Method

Description

If an illegal item name is included, this method reports an error.

If multiple item names separated by commas are specified (UPOS Specification), an error is reported.

The Statistics supported by ServiceObject are all defined in UPOS. If "M_" is specified, the minimum information specified by UPOS (the 4 items; UPOS version, manufacturer name, device name, and device category) is acquired.

3.2.10 UpdateStatistics Method

• Parameter type: Microsoft.PointOfService.Statistic[]

Parameter

Microsoft.PointOfService.Statistic[]

Specifies *Microsoft.PointOfService.Statistic* array for which item names and new values have been set.

Description

Of the items included in the specified category, only the items for which O appears for the update permission in "Appendix-F DeviceStatistics" are updated when "U_", "M_", or an empty string is specified for item names.

If an illegal item name or non-updatable item name is included, this method reports an error. In this case, correctly specified items are also not updated.

The Statistics supported by ServiceObject are all defined by UPOS. If "M_" is specified, nothing is updated.

• Parameter type: Microsoft.PointOfService.StatisticCategories

Parameter

Microsoft.PointOfService.StatisticCategories

Specify one of the following.

• StatisticCategories.Upos

• StatisticCategories.Manufacturer

• StatisticCategories.All

Specify the new value after

updating.

Object

Description

Of the items included in the specified category, only the items for which O appeared for the update permission in "Appendix-F DeviceStatistics" are updated.

All the statistics supported by the ServiceObject are defined in UPOS. If "StatisticCategories.Manufacturer" is specified, nothing is update.

3.2.11 UpdateStatistic Method

Description

Of the items included in the specified category, only the items for which O appears for the update permission in "Appendix-F DeviceStatistics" are updated when "U_", "M_", or an empty string is specified for item names.

If an illegal item name or non-updatable item name is specified, this method reports an error.

The Statistics supported by ServiceObject are all defined by UPOS. If "M_" is specified, nothing is updated.

3.2.12 BeginInsertion Method

Description

This device the exception is thrown because there is not a slip station.

3.2.13 BeginRemoval Method

Description

This device the exception is thrown because there is not a slip station.

3.2.14 ChangePrintSide Method

Description

This device the exception is thrown because there is not a slip station.

3.2.15 MarkFeed Method

Description

CapRecMarkFeed property is PrinterMarkFeeds.None the exception of "there is no function" is thrown.

3.2.16 EndInsertion Method

Description

This device the exception is thrown because there is not a slip station.

3.2.17 EndRemoval Method

Description

This device the exception is thrown because there is not a slip station.

3.2.18 CutPaper Method

Description

If the *percentage* parameter is 0, the method process ends without sending the command.

If the *percentage* parameter is from 1 to 100, activate the cutter to perform a partial cut leaving one point uncut.

3.2.19 PrintNormal Method

Description

Although the UPOS specification is such that an error is generated during synchronous printing if there is no line feed code, printing is successful when this method is executed even if a character string contains no line feed code.

See the table "<u>Appendix-E Escape Sequences</u>" for escape sequences supported by this device.

3.2.20 PrintImmediate Method

Description

Although "this method tries to print its data immediately – that is, as the very next printer operation" is written in the UPOS, with ServiceObject, the data of multiple transactions may be sent to the device during asynchronous printing. Therefore, data of the **PrintImmediate** method may not be printed immediately.

Although the UPOS specification is such that an error is generated during synchronous printing if there is no line feed code, printing is successful when this method is executed even if a character string contains no line feed code.

See the table "Appendix-E Escape Sequences" for escape sequences supported by this device.

3.2.21 PrintTwoNormal Method

Description

This device has only one station, the exception is thrown.

3.2.22 RotatePrint Method

Description

When ESC|#B is used to print an image, rotated printing takes places regardless of the PrintRotation.Bitmap specification of the *rotation* parameter.

The alignment parameter of each of the SetBitmap method,

PrintBitmap method, **PrintMemoryBitmap** method, and **PrintBarCode** method is also ignored.

If an exception is thrown when this method is called, the rotated print mode is not switched.

3.2.23 PrintBitmap Method

Description

This method enables a jpeg file, gif file, and bmp file to be specified. The resolutions for printing images are as follows.

Station	Landscape	Portrait
Receipt	80 dpi	72 dpi

3.2.24 PrintMemoryBitmap Method

Description

Only bitmaps created from jpeg files, gif files, or Windows bmp files are supported. The resolutions for printing images are as follows.

Station	Landscape	Portrait
Receipt	80 dpi	72 dpi

3.2.25 SetBitmap Method

Description

This method enables a jpeg file, gif file, and or Windows bmp file to be specified. Images are printed at the standard resolution of the device, regardless of the value of **RecLetterQuality**.

If a value other than PrintBitmap.Left or 0 is specified for the *alignment* parameter, an exception is thrown when a device is incapable of printing in the specified location.

3.2.26 SetLogo Method

Description

The following escape sequences cannot be specified in data saved using this method. If they are specified, an exception is thrown.

- ESC | tL
- ESC | bL

3.2.27 TransactionPrint Method

Description

If an exception is thrown when this method is called, the transaction mode is not switched. Furthermore, buffering data saved to the ServiceObject while in transaction mode is not cleared.

3.3 Events

3.3.1 DirectIOEvent

The properties listed below differ from functions described in UPOS.

• PTR DIE RESPONSE Event Number

Property

EventNumber PTR_DIE_RESPONSE

Data 0 (not used)

Object Stores the response from the printer

Description

When the PTR_DI_OUTPUT_NORMAL or

PTR_DI_OUTPUT_REALTIME command of the **DirectIO** method or the **PrintNormal** method/ **PrintImmediate** method involving ESC|#E results in the sending of an ESC/POS command that has a response from the device, the response is stored in the *Object* property and reported.

The ESC/POS commands capable of notification as a response are as follows.

- ESC u
- ESC v
- GS I (printer ID of 1 byte)
- GS r
- DLE EOT
- GS (C
- GS (L
- GS 8 L
- GS (G

PTR_DIE_SET_BITMAP_MODE Event Number

Property

EventNumber	PTR_DIE_SET_BITMAP_MODE
Data	Image save method
Object	Stores the key code

Description

Notifies of the save method used when the **SetBitmap** method saved an image.

One of the following values is set to the *Data* property.

Data	Meaning
PTR DIE MEMORY	Stored in the ServiceObject

3.3.2 ErrorEvent

Description

If the **DeviceEnabled** property becomes false while there is an **ErrorEvent** event queued state, the ServiceObject assumes that the *ErrorResponse* property has been set to ErrorResponse.Retry and performs the corresponding processing. Therefore, asynchronous output data is output again when the **DeviceEnabled** property becomes true. To prevent this data from being output again, execute the **ClearOutput** method.

Appendix-A Revision history

A.1 EPSON OPOS ADK for .NET 1.14.6

(1) Microsoft POS for .NET 1.14.1 is supported.

A.2 EPSON OPOS ADK for .NET 1.12

- (1) Microsoft POS for .NET 1.12 is supported.
- (2) Added response type issued by DirectIOEvnet.

A.3 EPSON OPOS ADK for .NET 1.11

- (1) Microsoft POS for .NET 1.11 is supported.
- (2) Changed Error codes for Hydra Devices.
- (3) Changed initialization sequence.

A.4 EPSON OPOS ADK for .NET 1.9

(1) Microsoft POS for .NET 1.1 is supported.

A.5 EPSON OPOS ADK for .NET 1.8

POS Device driver complied with Microsoft POS for .NET 1.0 specification has been provided.

This version has been created based on EPSON OPOS ADK 2.40. The following shows the difference between this version and EPSON OPOS ADK2.40.

Differences from EPSON OPOS ADK2.40

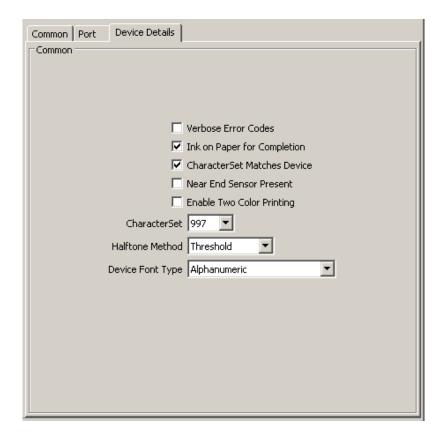

- All ErrorCode resulting in an exception being thrown and ErrorCodeExtended have been revised.
- (2) Commands that can be used with the **DirectIO** method were deleted or integrated. Therefore, some commands have been deleted or shifted to SetupPOS.
- (3) The DeviceEnabled property state was deleted from the issue conditions of queued events. Therefore, an event may be reported even if the DeviceEnabled property is in the false state.
- (4) The SetBitmap method dynamically saves an image to the most suitable location. The DirectIOEvent event notifies of the save location. The DirectIOEvent event notifies of the save location even if the device is set not

28

Application Development Guide POSPrinter (TM-U220A/U220B/U220D)

- to use NVRAM.
- (5) The print character count, print line count, line feed amount, and barcode print count of rotated 90-degree print mode and transaction print mode are reflected in the values that can be retrieved by the **RetrieveStatistics** method when printing is actually performed.
- (6) When the **Open** method is executed, a communication control class instance is generated. An exception is thrown if a communication control class instance is not generated when the **Open** method is executed.
- (7) Code page 254 and code page 255 are supported.
- (8) UPOS1.9 is supported.

Appendix-B SetupPOS Settings

This is the settings screen for the TM-U220B.

B.1 Verbose Error Codes Check Box

Description

Sets the error code type for during output.

State	Meaning
Checkmark added	Sets the timeout to ErrorCodeExtended for
	an error that occurs during output.
No checkmark added	Sets the printer state as is to ErrorCode or
	ErrorCodeExtended, regardless of whether
	the error occurred during output.

Default: no checkmark added

30

Application Development Guide POSPrinter (TM-U220A/U220B/U220D)

B.2 CharacterSet Matches Device Check Box

Description

Sets whether the setting for the international character set is changed automatically to match the value of the **CharacterSet** property.

State	Meaning
Checkmark added	Sets the international character set to match
	the value of the CharacterSet property.
No checkmark added	Sets the international character set of
	America in the CharacterSet property.

Default: checkmark added

B.3 Enable Two Color Printing Check Box

Description

Sets whether to perform two color printing.

State	Meaning
Checkmark added	Performs two color printing on receipts.
No checkmark added	Performs one color printing on receipts.

When set to perform two color printing

The CapRec2Color property is set to PrinterColors.Primary | PrinterColors.Custom1.

Using the **PrintBitmap** method to perform two color printing becomes possible.

Using the escape sequences of the PrintNormal and

Printlmmediate methods to perform custom color printing becomes possible.

Default: no checkmark added

B.4 Near End Sensor Present Check Box

Description

Sets whether the device has a near end sensor.

State	Meaning
Checkmark added	The device has a near end sensor.
No checkmark added	The device has no near end sensor.

When set to device has a near end sensor

The value of the **CapRecNearEndSensor** property becomes true. The **StatusUpdateEvent** event enables you to know when there is not much paper left.

Default: no checkmark added

B.5 Ink on Paper for Completion Check Box

Description

Sets whether to check that printing operation is complete.

State	Meaning
Checkmark added	Judges the printing method to be complete
	when the device completes printing.
No checkmark added	Judges the printing method to be complete
	when data output is complete.

When set to judge method output to be complete when the device completes printing

Printing on the device and the printing method are not completely synchronized. The method can be completed quickly. If the value of the **AsyncMode** property is set to true, the completion of printing is reported before the device actually completes printing because the **OutputCompleteEvent** event considers the printing method to be complete when the data output is complete. Printing is judged to be successful if method output completes even when an error was generated on the device during printing.

Default: checkmark added

B.6 Halftone Method Combo Box

Description

Sets the halftone method type used during image printing (execution of **PrintBitmap** method).

Item	Meaning
Threshold	Uses the threshold method (monochrome conversion) on the specified image file, and
Error Diffusion	then outputs it to the device. Performs error diffusion processing on the
	specified image file, and then outputs it to the device.
Dithering	Performs dithering processing on the specified image file, and then outputs it to the device.

Default: Threshold

B.7 Device Font Type Combo Box

Description

Sets the multi-byte character font of the device.

Item	Meaning
None (ANK)	The device has no multi-byte character font.
Japanese	The device has a Japanese font.

When set to the device has a Japanese font

The CharacterSet property is set to 932.

932 exists in the CharacterSetList property.

Printing Japanese using the **PrintNormal** method and

PrintImmediate method becomes possible if the **CharacterSet** property is 932.

Default: None (ANK)

B.8 Receipt Width Combo Box

Description

Sets the receipt paper width.

Item	Meaning	
58 mm (TM-U220B/TM-U2	220D) The r	eceipt width is 58 mm.
70 mm (TM-U220B/TM-U2	220D) The r	eceipt width is 70 mm.
76 mm (TM-U220B/TM-U2	220D) The r	eceipt width is 76 mm.

Default: 76 mm

B.9 CharacterSet Combo Box

Description

Set the initial value of the **CharacterSet** property. Select from a Character Set list depending on the setting of the **CharacterSetList** property. Selectable values change depending on the Device Font Type Combo Box setting.

Item	Meaning
997	All the printable characters installed on device can be assigned to Unicode and printed.
254,255,437,850,852, 858,860,863,865,866,	Printed with the standard code page.
932	Only when DeviceFontType is set to "Japanese"

Default: 997

Flauit. 991
